

Independent Milking Machine Testing & Mastitis Control

Neville Brentnall
Tel. 07875 463617

Neville Brentnall, P&L Parlour and Mastitis Specialist, advises on:

- Parlour Management including static and dynamic milking machine testing
- Record keeping and interpretation of mastitis and cell count data
- Cow welfare and environmental issues
- All aspects of mastitis control

This is what just a few P&L clients have to say:

"A year ago our high cell counts were imposing heavy financial costs on the business. Phil Clarke, our P&L Consultant, suggested we call in Neville to help us re-establish a mastitis management and control program. This, along with his visits at milking times, and continued monitoring of milk quality, have helped to reduce the incidence of both mastitis cases and cell counts to very acceptable levels." **Mr D. Pym, Cheshire**

"We had issues with cows milking out unevenly and incompletely leading to rising cell counts and an increased incidence of mastitis. We called in Neville who identified and corrected a significant pulsation problem. The cows are now more settled, milking out well and cell counts have fallen along with the number of mastitis cases." **Mr & Mrs Cannon, Flintshire**

"We have used P&L for many years for the business side of things, however our cell counts were rising with significant financial penalties. Neville has stripped back and re-built our knowledge of mastitis management, and along with testing our plant on a regular basis, cell count penalties are now a thing of the past." **Mr & Mrs D Ford, Cheshire**

"Our cell counts were too high, and mastitis cases were rising. Neville assessed the overall position: he re-jigged the milking routine, advised on some technical changes to the parlour as well as highlighting some issues relating to the housing. The mastitis case count has since fallen from 70 per 100 cows per year to just 20 and cell counts are now consistently low: We are on a better footing thanks to Neville's advice and intervention." **Mr D. Parry, Anglesey**

If you have any of these:

- Too many mastitis cases
- Cell counts too high
- Bactoscans too high
- Bactoscan fluctuations
- Disappointing yields
